Safescape® Other Applications

Safescape is more than a system to be retro-fitted to trains and buses. It can be designed into new trains or buses and can be used on other windows - in homes, buildings or laboratories.

Bespoke Design

You may have an application you wish us to help you with, for example AST has been working closely with rail, bus and window manufacturers for many years, we are currently working on solutions that fit seamlessly with new vehicle design. Being involved at the beginning of the project means that customers can take advantage of our considerable knowledge in this field.

Architectural Applications

Safety and emergency escape are important issues facing many of our industries. The need for rapid escape from buildings is always a concern especially from enclosed areas, such as in laboratories. Although there are many mechanical and electronic devices already available for emergency escape, Safescape® has the advantage over emergency doors and windows in that it cannot become jammed or blocked and therefore is more reliable.

Safescape® may be considered for the following uses

- For emergency exits in buildings
- For rapid escape systems in the oil and gas industries
- For fast access to vehicles
- Rapid access to buildings by emergency services
- For maritime vessels
